The original article can be found online at <https://doi.org/10.58742/bmj.v1i1.19>

The article mentioned above, which was published online on 10th of October, 2023, in Barw Medical Journal (Complications of Abdominal Wall Hernia Repair Using Mesh: A Single Cohort Study), has been retracted as a result of an agreement between the journal's Editor in Chief, Professor Kawkab Shishani, and Barw Publisher. The publisher learned from a third party that several articles had similar formats and structures. Also, there was a conflict between the authors; not all authors approved the last version of the manuscript. These all lead to the decision to retract it. The authors did not respond to the notification of retraction.

Afflicted by these nations originate from the activities of multinational corporations or the global demand for certain goods. There is a moral imperative for developed countries and international organizations to assist in the fight against environmental pollution and its health repercussions.

In conclusion, environmental pollution is not merely an economic or ecological issue; it is a profound public health crisis with cancer at its forefront. As developing countries continue their journey toward growth and development, ensuring a balance between progress and environmental stewardship is crucial. Failure to address this balance will not only undermine health outcomes but also threaten the sustainable future of these nations. The time to act is now, with concerted efforts from local, national, and global stakeholders to mitigate the risks and safeguard the well-being of current and future generations.
